

CTP Engine Valves

CTP Bimetallic & Trimetallic Valves

CTP Engine Valves are manufactured to specifications. The CTP bimetallic operation for the engine valves is extremely important. The valves are welded using a friction-welding machine that merges the two pieces of material (Austenitic on the head and Martensitic on the stem). The process gives the valves a higher resistance to withstand the extreme temperatures of the engine. This is especially necessary for the exhaust engine valves, which are always stressed by higher temperatures compared to the intake valves.

The valve seats, especially on the exhaust valves, are subject to a chemical and a mechanical corrosion. For this reason, for the CTP trimetallic valves, Stellite (metal alloy) is welded on the seat of the valve to improve its endurance. The Stellite gives the seat a higher hardness for better resistance to the mechanical stress. The type of Stellite (cobalt base Stellite) used gives the seat a higher resistance to the chemical corrosion. We emphasize on the concentricity of the bottom of the valve to guarantee the perfect adjustment with the insert.

The measurements of the valves are also verified with a laser instrument to ensure its precision.

Engine Valves:
